Insights

- Most passengers were between 80 and 100.
- Fare shows a right skewed distribution.
- About 60% of passengers did not survive.
- People in 1st class had a much higher survival
- Females had a significantly higher chance of survival than males.
- Passengers who embarked at port C had a higher survival rate.

The relationship between passenger class and survival is important because it highlights a disparity in survival rates across the classes.

- Survival rate between passenger class and higher survival rate
